

Managed Disaster Recovery as a Service (DRaaS)

98% of organizations say a single hour of downtime costs over \$100,000*— companies who aren't protected are at serious financial risk.

Every business in the world needs to keep apps & data safe & available during downtime and recover from it as soon as possible. Some companies find it burdensome and costly to maintain the hardware and software required for disaster recovery processes.

ZNetLive DRaaS meets your business continuity requirements, ensuring that workloads are always protected, at a low cost.

How managed Disaster Recovery service helps?

DRaaS helps you meet Business Continuity and Disaster Recovery (BCDR) requirement to keep organizational data and workloads safe, available and recoverable during outages. You can set up and manage failover, replication, and failback from a single location with reduced TCO than setting up your own datacenter.

Why managed DRaaS?

- Protect your organization & branch locations without in-house management complexities
- No need to invest in secondary sites or infrastructure maintenance
- With DRaaS, shift from CAPEX to OPEX
- Customizable recovery policies to achieve the near-real time RPOs and RTOs objectives required via application consistent snapshots, near-synchronous replication, and wide geo-availability
- Run planned failovers/disaster recovery drills for expected outages with zero-data loss, or unplanned failovers with minimal data loss (depending on replication frequency) for unexpected disasters

Replicate workloads in on-premise data center to cloud

- Certified support
- Heterogeneous environments protection

Cloud to cloud – geo-replication to address latency issue

- Geo-replication options
- Superior protection against operational and human errors

Site to Site – Leverage your own datacenters as recovery targets

- Automated replication and policy based protection for virtual machines, and physical servers
- One-click, orderly recovery of applications to an alternate site

Get benefit from a pay-as-you-go model, limit CAPEX, lower TCO

Get premium SLAs & HA services for mission critical applications

Support for heterogeneous environments with tested DRaaS

The cost and complexity of managing multiple datacenters can be prohibitively expensive. Additionally, as the amount of applications that need protection in your organization grows, so do the requirements for new infrastructure. With ZNetLive managed backup and disaster recovery services, you get near-infinite scalable service, without the ongoing maintenance requirements.

Our deep expertise in cloud services ensures that you get the best managed DR strategy that is failproof and complete.
